ABSTRACT OF THE DISCLOSURE

Methods, systems, computer program products, and data structures for displaying data on a web browser interface where the data in its native format is not displayable on a web browser interface. A network server receives a request for content from a network device where the request includes a request for data that is not displayable on a web browser. The network server identifies a template, which will be used to transform non-displayable data into displayable content. The network server accesses non-displayable data that is stored on a data server and processes the accessed non-displayable data according to the identified template in order to transform it into displayable content. A template may include HTML code as well as customized tags. The customized tags are consumed by a rendering engine, which executes certain functions to modify the data, making it displayable content. Once transformed, displayable content is sent to the network device.
